TRU BLU K9000 DOG WASH HAIR FILTRATION

The K9000 dog wash incorporates a 3 stage hair filter System.

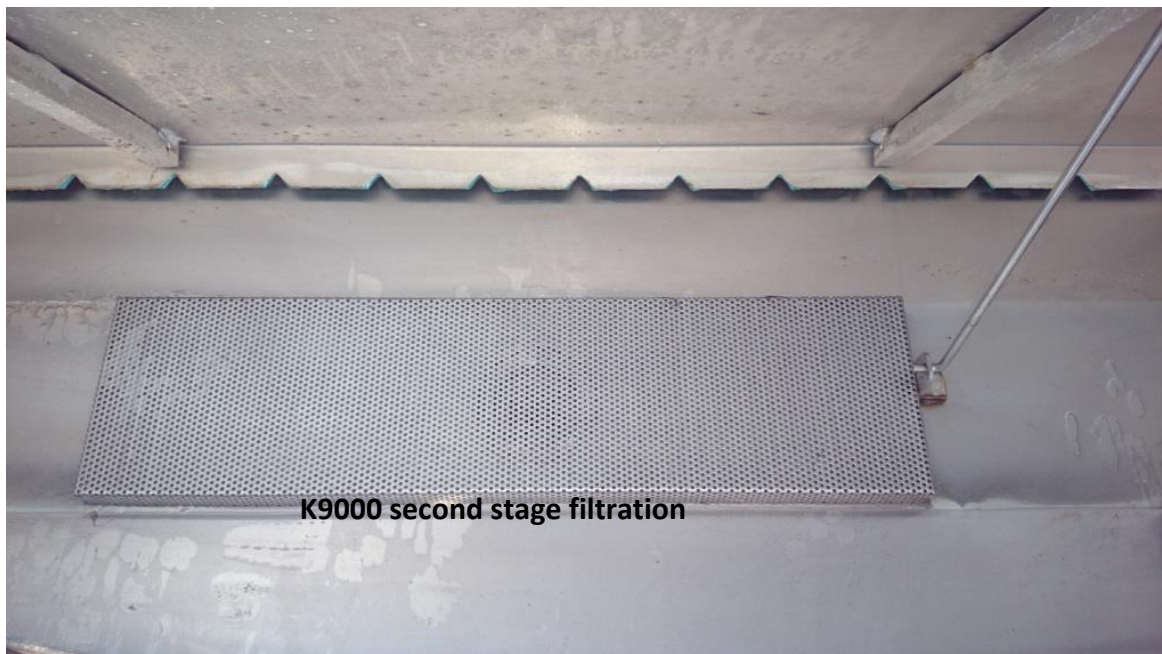

The first stage is built into the main floor section, with a series of small water ports (36 in total), port area size of 20mm, spaced every 100mm around the base of the floor; this retains long hair above 50mm in length.

The second stage is a removable perforated filter screen made of stainless steel; the filter screen has a surface area 45sq cm with 3mm hole perforations, this in turn retains the remainder of the hair.

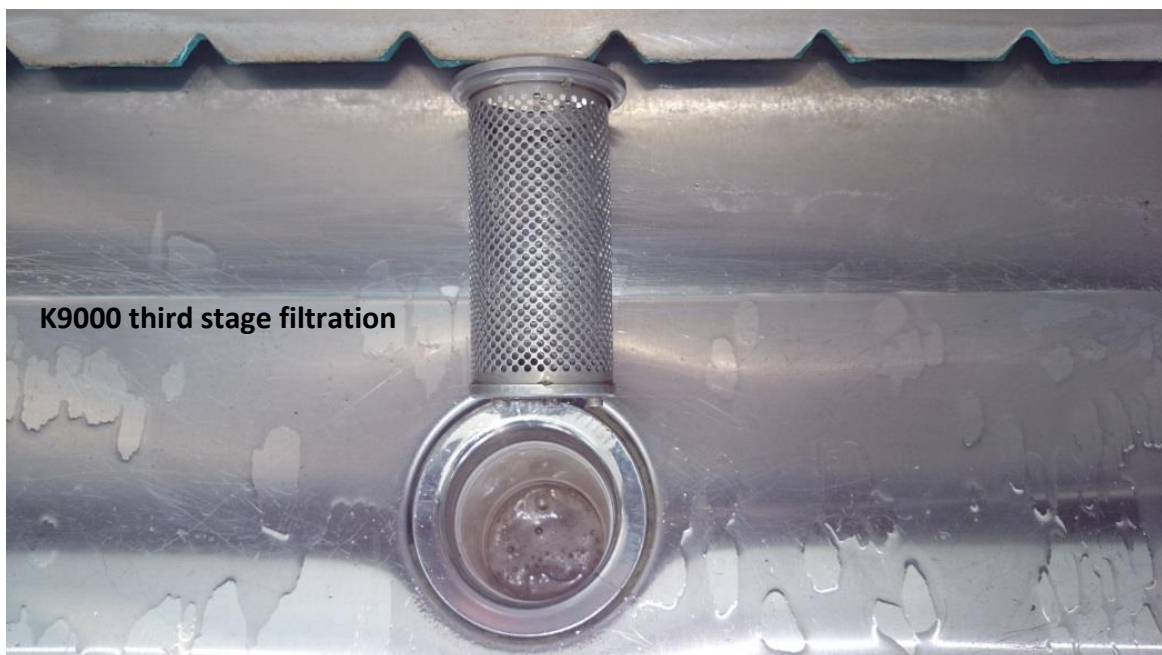

The third stage is an approved In-Sink DBA, which has a removable filter basket, which in turn reinforces the first and second stage of filtration to maximize hair catchment. Please find attached photos and Information regarding to this system.
