

The Matrix: how the **agent fleet** builds PetWash™ Care

One brain, many hands. A doctrine for splitting every piece of work across Claude, Codex, and Xcode — so the machine moves fast and never ships something nobody reviewed.

Edition June 2026 **Posture** Generate · Judge · Ship **Targets** iOS · Octopus Core · AI services
Rule Reversible · Reviewed · Monitored

01 · THE DOCTRINE

Three lanes. Nobody crosses unreviewed.

Speed comes from the right hands doing the right work — not from any one agent doing everything.

Codex generates. Claude judges. Xcode ships. A human signs off at every gate.

Each lane is best at one thing and weak at the others. Codex is fast hands with no judgment. Claude is judgment with no shipping authority. Xcode is the only thing that actually builds, signs, and reaches a real iPhone. Keep them in their lanes and the whole organism stays fast and safe.

Who is good at what

Assign by strength, not by convenience. The wrong agent in the wrong lane is how production breaks.

SYSTEM OF RECORD

Xcode 26

The only thing that ships.

- Build, sign, provisioning
- SwiftUI previews & Interface
- Instruments — profiling & leaks
- TestFlight & App Store submit
- CI gate before main

Humans drive it. Nothing reaches a phone without it.

VOLUME HANDS

Codex agent

Fast generation, zero judgment.

- Scaffold SwiftUI views
- Boilerplate & repetitive refactors
- Unit / UI test stubs
- Typed API client from OpenAPI
- First drafts, never final

Output is a proposal. It is reviewed before it counts.

JUDGMENT & ORCHESTRATION

Claude agents

Decides, reviews, coordinates.

- Architecture & ADRs
- Work-splitting / anti-duplication
- Security · privacy · a11y review
- Root-cause debugging
- Legal, docs, watchdog design

Routes the work and guards the gates — but never merges blind.

Every task, routed

Read it left to right: who leads, who must check it, where it lands. No work skips the middle column.

WORK	LEADS	CHECKED BY	SHIPS VIA
New screen / SwiftUI view	Codex	Claude a11y · brand · RTL	Xcode
Architecture decision (ADR)	Claude	Human CTO sign-off	/docs repo
API client from OpenAPI	Codex	Claude types · errors	Xcode
Auth · payments · KYC code	Claude	Human security review	Xcode
Bug, cause unknown	Claude root cause	Codex drafts fix	Xcode
Tests (unit / UI)	Codex	Claude critical-flow coverage	CI
Legal / compliance text	Claude	Counsel licensed IL	—
Watchdog / monitoring logic	Claude	Human	Core

Anti-duplication law: one identity service, one ledger, one design system. Before any agent writes, it checks the module map. Two agents must never build the same thing twice.

Where the intelligence runs

Private data stays on the device. Heavy thinking runs on the Core — and never sees a raw ID.

ON DEVICE — PRIVATE

Apple Intelligence / Foundation Models

- Document glare & blur guidance
- Liveness / face-match hints
- On-device drafting & summaries
- **No PII leaves the phone** for routine tasks

OCTOPUS CORE — HOSTED

The routing & forecasting brain

- Scheduling, routing, demand forecast
- Provider quality scoring
- Works on **tokens, never raw ID numbers**
- Heavy compute, audited, region-pinned

Tool rule: agents may read freely — search, files, build logs. Every write passes a review gate. AI assists and proposes; humans and Xcode decide and ship.

The organs that keep it alive

Always-on watchdogs protect the company and the providers. Every risky change is reversible by design.

Sentinel
Auth anomalies, impossible-travel logins
→ **step-up, lock, alert**

Ledger-Keeper
Financial irregularities, fraud patterns
→ **hold + flag finance**

Compliance-Hound
Expiring docs, lapsed insurance/licence
→ **block job, notify**

Welfare-Guard
Skipped welfare checks, complaint clusters
→ **pause, escalate**

Evidence-Vault
Tamper attempts on the audit log
→ **immutable capture, legal hold**

Privacy-Warden
Unusual personal-data access, export spikes
→ **throttle, alert DPO**

Feature flags + rollback
Every risky change ships behind a flag with a documented, tested rollback. Reversible by default.

Staged rollout
Internal → TestFlight → phased %. Auto-halt on an error-rate spike, before users feel it.

One event spine
Every arm reports home — telemetry, audit, money — visible from a single control panel.

On-call runbook
Alerts wired to a human. The rollback command is known and rehearsed, not improvised.

Non-negotiable for every agent

- 01

Root cause, never a band-aid.

No fix that hides a defect.
- 02

Remove stale code; never duplicate a system.

One identity service, one ledger, one design system.
- 03

Temp hacks carry an expiry note + removal task.

Tracked, not forgotten.
- 04

Risky change → feature flag + documented rollback.

Always reversible.
- 05

Small, reviewable, revertible PRs.

No giant merges.
- 06

No AI-generated code reaches main unreviewed.

A human reviews; Xcode compiles; then it ships.

How a change moves, end to end

01

Audit

Claude maps the current state

02

Propose

ADR / design note for anything architectural

03

Implement

Codex drafts in a flagged, modular PR

04

Review

Claude + human pass the gates

05

Release

Xcode → TestFlight → phased rollout

06

Observe

Watchdogs watch; then clean the flag

Audit → Propose → Implement. Production-safe. Reversible. Nothing here overrides licensed Israeli counsel on legal items, or a human reviewer on code.
